RESEARCH INTERESTS

The main interest is bridging the gap between the traditional areas of solid mechanics and materials science, with applications in both, materials processing and applications, and with particular interest in computational methods and multiscale modeling: formulation of the problem based on the micro-physics of the process and its computational implementation. Specifically, current interests include:

- plasticity of crystals and interfaces
- micromechanics of granular materials
- computational methods for coupled moving boundaries problems (phase transformations, wetting)
- collective behavior of carbon nanotubes
- contact and adhesion mechanics on nanoscale
